

MEDICAL GAS CYLINDER STORAGE

What Is Medical Gas?

Medical gas refers to oxygen, nitrous oxide, medical air, carbon dioxide, helium, nitrogen, instrument air, and mixtures of these gases. They are used for many purposes in health care facilities including in the application of human respiration and the calibration of medical devices used for human respiration.

Hazards of Medical Gases

A common hazard in a health care facility is storing and handling compressed gases in cylinders. Medical gas cylinders are supply tanks that contain gases at pressures that can be in excess of 2000 psi.

Two types of hazards are associated with medical gas equipment:

- 1) General fires and explosions enhanced by oxygen-rich atmospheres
- 2) Mechanical problems such as physical damage to compressed gas cylinders

The requirements of NFPA 99, *Health Care Facilities Code*, for storing and handling medical gas cylinders aim to minimize hazards with the design and construction of cylinder storage locations and safe operation and handling of the cylinders.

How NFPA 99 Applies

Guidance for keeping patients, staff, and the public safe in facilities with these cylinders is offered in the 2018 edition of NFPA 99. Chapter 5 covers piped medical gas systems and requirements for cylinder storage locations that have large volumes of stored gas. Chapter 11 includes requirements for all other storage and handling of medical gas cylinders.

Guidelines for Medical Gas Storage

A newly updated NFPA White Paper, "Medical Gas Cylinder Storage," identifies the requirements of the 2018 edition of NFPA 99 that detail the storage and handling of these cylinders in a health care facility. The document explains:

- Types of hazards that exist
- Storage location design and construction
- Signs and identification needed
- Ventilation required
- Safety precautions that must be taken when working with these cylinders
- Typical volumes in different size cylinders based on gas

Safety Precautions For Handling Cylinders

- Handle oxygen cylinders and manifolds based on CGA G-4, Oxygen
- Protect cylinders from contact with oil and grease
- Protect cylinders from contamination
- Protect cylinders from damage
- Secure cylinders from falling
- Handle cylinders with care
- Remove/repair defective equipment
