Building Conditions

Deferred Submittals (field verified): 1. The truss specification sheets need to be reviewed by the engineer of record and approved in written form prior to the inspection of the roof. This may be done as a deferred submittal when the actual truss specification sheets are provided.

Cinnamon Ridge (IGES August 2004)
Roof Snow Load: 50 psf; WInd Exposure C; Soil Bearing Pressure: 3000 psf
Fire Sprinklers required

1) Provide a letter from the geotechnical engineer stating that the foundation excavation and subgrade was prepared in accordance with the geotechnical report for the project and that the subgrade for foundation and slab support is ready for the placement of concrete prior to placing concrete for footings and flatwork.
2) It is the responsibility of the builder to comply with all of the requirements of the geotechnical report.
3) All import materials to be approved by geotechnical engineer.
4) Permanent cut slopes should not be steeper than 1.5H:1V.
5) All organics, topsoil, existing fill and other deleterious material should be removed from below building and exterior flat work areas.
6) Footings supported by fine grain soil should be underlain by one foot of granular structural fill.
7) In areas where bedrock is encountered, footings should not be placed partially on bedrock and partially on fine grained soils or fill. In such cases, footings should be excavated to bear entirely on bedrock or the foundations should be established entirely on a minimum of 18" of structural fill or soil.
8) In areas of collapsible soils, floor slabs should be underlain by 18" of structural fill. In areas of highly plastic/expansive soils, 18" of native materials should be removed and replaced with structural fill.
9) All floor slabs should be underlain by 4" of free draining gravel.
10) At the time of the excavation observation, the geotechnical engineer will determine the need, or not, of a foundation drain based on the depth of the excavation and the presence of collapsible soils that extend up to 5' deep. Whether the foundation drain is needed or not shall be stated in the report.

*****A SWPPP inspection MUST be completed, and approved, before starting excavation, or grubbing. Please contact Lucas Fowler, Draper City Engineering, at 801-576-6331 for this inspection. *****

b.Foundation Drain & Waterproofing – must be completed before starting foundation backfilling.
c.Backwater Valve – MUST be installed at the time of the sub-rough inspection. Depending on site elevations, backwater valves MAY be required on first floor plumbing. PLEASE CHECK SITE Elevations BEFORE installing backwater valves.
d.Suspended Concrete Slabs at Garages and Porches – prior to placement of concrete, and after rebar is in place.
3.A wood or steel curb ramp shall be in place only at the time of deliveries, and then promptly removed. Ramps made of soil, gravel, or similar materials are NOT permitted.
4.Foundations that are within 6 feet of the property line shall have, at the time of the footing inspection, a string line strung tight along the property lines. Materials, grubbings, debris, and stockpiles shall NOT be placed along any property lines requiring verification.
5.All compaction for interior and exterior backfill adjacent to building shall be verified by the geotechnical engineer.
6.Trash Container must be on site prior to any framing.
7.Portable toilets and trash containers shall NOT be placed in the right-of-way. In addition to roadways, the right-of-way includes sidewalks and all park strip areas.
8.Appropriate grading of the property must be completed immediately after backfilling the foundations.
9. Provide the listing information for the stucco system that will be used.
10. Provide an insulation certificate for attic / ceiling areas to the inspector at, or before, the final inspection.
11.All slopes exceeding 10% must be landscaped prior to the final inspection approval.
12. Final grades, as shown on approved site plan, the must be in place. This includes all drainage swales, detention areas, and berms.
